Abstract (en)
[origin: WO2005085056A1] The present invention relates to a tugboat, with application in maneuvering of a vessel. A problem for better maneuvering during tugging has been solved. The tugboat comprises a hull, where on the hull deck is positioned a movable command cabin and are installed devices for ropes for tying the tugged vessel. To the hull (1) are installed two Z- drives (2) in close proximity to the tugboat hull (1) periphery, they are positioned at max distance one from the other. On one of the hull (1) boards, in symmetry to the transverse plane are installed joint devices (5) for side contact and device (7) for front contact with tugged vessel bow. On the other hull (1) board, also in symmetry to the transverse plane, are installed joint devices (5) uniform with the mentioned above joint devices (5) for side contact and a device (8) for front contact.
