Abstract (en)
[origin: WO2005100184A1] The invention relates to a bag with a wall (1), which is comprised of at least one ply made of flexible material from which a tubular shape with two open ends is formed by folding down sections in a longitudinal direction and by a strip-shaped permanent joining (2) together of the sections, which are folded down and placed against one another, said joining extending in a longitudinal direction. Of the two ends, a first end is closed for filling the bag, and a second end is to be closed once the bag has been filled. An outer side of an outer ply (3) of the wall (1) is printed. Additional easily accessible information surfaces (10, 10') are produced during the production of the bag in such a manner that one of the sections of the outer ply (3), together with an end piece (4), projects beyond the bonding (2) and, together with its free end, can be attached in an easily detachable manner to the area of the outer ply (3) located thereunder, and in that an additional information surface (10, 10') can be exposed after the end piece (4) has been detached.
