Abstract (en)

[origin: WO2005116338A1] The invention relates to a device for adjusting the position of a rail or a track structure comprising at least one rail in relation to a supporting substructure. The aim of the invention is to allow efficient and simple adjustment also in the cambered areas of rail bends. The adjusting device should also be independent of possible length variations of the rails and should be easy to disassemble from the concrete floor slab if significant length variations occur. For this purpose, the device comprises at least one fixing element (2), directly acting upon the rail (1), which is supported by at least one connecting element (3) on the supporting base, said connecting element being tiltable about an axis parallel to the longitudinal axis of the rail (1).
