Abstract (en)

[origin: WO2005085829A1] The invention relates to a device for measuring living cells or similar biocomponents comprising a field effect transistor (1) which is provided with a source, a drain and a channel area (4) placed on a substrate. Said channel area (4) connects said source and drain and is provided with a gate-electrode (8) mounted thereon. The gate electrode (8) has at least two laterally disposed parallel electrode areas (10) which are perpendicular to a direction in which the channel area (4) connects the source (3a) to the drain (3b) in such a way that they are distant and electrically insulated from each other.
