Abstract (en)

[origin: WO2005114856A1] The invention relates to an upgradable product which makes it possible to industrially produce a single easily configurable circuit with low production costs. The production costs are reduced by increased production volumes. The external unit of a receiving terminal provided with a feedback channel comprises passband filter means (206) for passing translated signals situated in a transmission widthband (401) and rejection filter means (205) for rejecting at least one frequency situated in the transmission widthband (401), wherein said rejection filter means is neutralised when neither the defined oscillator frequency no the frequency multiple thereof is situated within the transmission widthband.
