Abstract (en)

The material has a plastic material substrate (1), and an electrically conductive strip (2) applied on an upper surface of the substrate, where the substrate is made of polyester e.g. polyethylene terephthalate (PET). The strip is interrupted in a zone that is covered of a conductive stud adapted to contact with the strip in response to a transversal force of the substrate in order to establish electrical continuity of the strip. Another electrically conductive strip (3) is applied on a lower surface of the substrate, where the strips are disposed, along misaligned patterns, on the surfaces. An independent claim is also included for a protected container comprising base and cover elements covered by a film material.
