Abstract (en)
[origin: WO2005108004A1] The invention relates to a device and a method for the production of microstructures, comprising a spindle driven in rotation about a spindle axis, on which a housing for clamping a workpiece is provided, and an actuator (30), which has a rapid drive (36), in particular a piezo-drive for generation of a rapid movement of a tool (32) in a direction essentially perpendicular to the workpiece surface, whereby the actuator (30) may be positioned by means of a further drive (24) for generation of a linear movement in a first direction along a workpiece surface for machining (24). The rapid drive (36) is coupled to the tool (32) by means of a guide device (38) which permits an adjustment of the tool (32) in the axial direction of the rapid drive (36) against a return force and which presents a high rigidity in a plane perpendicular thereto. The applied control technology permits a precise and reproducible production of microstructures using the dynamic system properties.
