Abstract (en)  
[origin: WO2005102889A1] The invention relates to a folding appliance comprising: a folding blade cylinder (01) carrying at least one group of identical tools (02) homogeneously distributed about the periphery thereof, a cam plate (07) which is traced by a control lever (04) of each of said tools and is used to control a working movement of the tool, and a covering disk (03) that consists of a plurality of covering cams (11; 12) and can be rotated by the folding blade cylinder, the covering cams of said covering disk being displaceable between an inactive position wherein they enable the control of the working movement by the cam plate, and an active position wherein they prevent the control of the working movement by the cam plate. Five tools are used, and the covering cams form a first group (11) of cams at an angular distance of between 60 DEG or 120 DEG to each other, and a second group of cams (12) at an angular distance of between 90 DEG or 180 DEG to each other.
