Abstract (en)

[origin: WO2005104029A1] Disclosed is a method of embedding both a robust and a fragile watermark in an information signal which is compressed so as to include first signal samples having a first given value and further signal samples having a different value, wherein embedding the robust watermark. The method comprises the steps of: modifying signal samples in accordance with a watermark pattern if the act of modifying results in the modified signal sample assuming the first value; and wherein embedding the fragile watermark comprises the steps of: counting the number of 'ones' remaining (R) in the signal as a result of embedding the robust watermark; counting the number of 'ones' discarded (D) from the signal as a result of embedding the robust watermark; and determining a fragile payload on the basis of said remaining ( R ) and discarded (D) 'ones'.
