Abstract (en)
[origin: EP1743613A1] The invention proposes an adjustable motion wheel chair comprising: a back panel (50); a seat panel (62); a mobility base (12) for supporting the back panel (50) and seat panel (62); a pair of control plates (26) positioned laterally across the mobility base (12) in spaced apart parallel relation; each control plate (26) mounted to the mobility base (12); the back panel (50) including a pair of pivot pins (104) located on opposite lateral edges of the back panel and which are pivotally received by a respective control plate (26); a linkage member (78) hingedly connecting the seat panel (62) to the back panel (50); each control plate (26) including a forwardly extending limiting means (36) for limiting the downward movement of a front edge of the seat panel (62). The adjustable motion wheel chair can be used in either a static mode with a back panel and seat panel in a fixed relation and can also be used in a dynamic mode where a user can stretch by opening the angle between the seat panel and back panel and be able to return to the bent sitting position.
