Abstract (en)

[origin: WO2006128664A1] In a method for producing plastic sanitary articles with surfaces metallized by electroplating, before it is metallized by electroplating using an external current source the sanitary article has at least one electrically nonconductive component. This component at least partially decouples the water-carrying regions of the sanitary article at least partially from the current flow during metallization by electroplating using the external current source. The component is preferably a separate component which can be reversibly connected to the sanitary article. The invention also includes the component for decoupling the current itself and a sanitary article provided with the component.
