Abstract (en)

[origin: WO2005112422A1] The invention relates to a method for sending an image (11) and a method for receiving and representing an image (31) in a network (7). Said methods are characterised in that the image (11) is decomposed into at least two sectors (12) before the emission thereof, and a data unit (13) is produced for each sector (12), said data unit containing the image content of the corresponding sector (12) in an encoded form, and information on the relative position of the corresponding sector (12) inside the image (11). Inversely, corresponding sectors (32) are combined on the basis of received data units (33) in order to form an image (31). The invention enables the consequences of transmission errors, especially in wireless networks, to be minimised.
