Abstract (en)

[origin: EP1746283A1] A system comprises at least one connector and at least one connecting device (14) with a counter connecting part (16). The connector (10) has a connecting part (12) being designed for mating with a counter connecting part (16) of the connecting device (14). The connector (10) comprises at least one lever being pivotably arranged in the connector (10) and being mechanically coupled to a lifting unit (18), such that a change in lift of the lifting unit (18) is transformed into a pivoting movement of the lever. The lever is designed and arranged such, that the pivoting movement results in an axial displacement in an axial direction of the connecting part (12) of a coupling area (32) of the lever being provided for being coupled with the connecting device (14).

[origin: EP1746283A1] The connector has a connecting part (12) that is connected with a counter connecting part (16) of a connecting device (14), and a lever (26) arranged in the connector in a pivotable manner. The lever is mechanically coupled to a lifting unit (18), such that a change in lift of the lifting unit is transformed into a pivoting movement of the lever. The lever is coupled and arranged, such that the pivoting movement results in an axial displacement of a coupling area of the lever in an axial direction of the coupling part, where the area is coupled with the connecting device. An independent claim is also included for a system comprising a connector.
