Abstract (en)
[origin: EP1746307A2] The torsional vibration absorber for a direct drive clutch of a hydrodynamic clutch arrangement has one transmission element linked to the input side and a second transmission element (65,68) linked to the output side moving against the forces of springs (73a,73b,73c,73d) in relation to the first. At least one of the elements (65,68) is provided with spaces (75a,75b,75c,75d,75e,75f,75g,75h) for the accommodation of the springs (73a,73b,73c), the borders (81d,81f,81h,81k,81o,81q) of the spaces serving as control elements for the springs. The action is only initiated when at a predetermined deflection level (U1,U2) is reached and the threshold value for a minimal distance for the rotation angle is exceeded.
