Abstract (en)

[origin: EP1746780A1] The method involves establishing a connection between a home equipment (Tr) and internal points (PIu) of a home gateway, and obtaining configuration data (Ds) relative to a requested service. An internal connection defined between one of network interfaces (IEo) and one of the internal points is configured from the configuration data, where the data defines a bijective relation between access point (APs) and the service. The relation between the access point and the service is modified by replacing the access point by a new access point. An independent claim is also included for a home gateway for transporting services of communication network from a network interface of the gateway to an internal point of the gateway through the internal connection.
