Abstract (en)

[origin: WO2005110835A1] The present invention proposes an improved method for at least partly compensating the dynamic axle load transfer when part of a vehicle load dips over at least one front wheel. Firstly, in order to compensate the axle load transfer, a drive torque demand is applied and thus a temporally limited, approximately maximum drive torque is requested. Moreover, the present invention proposes for the first time a microprocessor as well as a control device for implementing the claimed method. The invention also concerns a vehicle drive which is fitted with this type of control device or microprocessor. Software for implementing the method is also described. Finally, the invention concerns a motor vehicle that is equipped with this type of control device or microprocessor for running the software for implementing the claimed method.
