Abstract (en)

[origin: EP1748125A2] The scaffold has a support structure (4) with connection pieces (10) and constitutive elements such as a jamb, cross bar, post (7) and cross-arm, where one element is formed from a section, in form of rails (9) arranged on two opposite sides of the section. Each connection piece has two rails (11) each with a shape complementary to the rails (9). Each connection piece permits to assemble one of its rails with one rail of the element for allowing axial displacement of the piece on entire length of the element while letting free the other rail of the element.
