Abstract (en)

The unit has a compartment of appropriate dimension for receiving a product, where the compartment is defined by a bottom (4) and lateral walls (12-15). The bottom receives an intermediate support-element (5) integrated to a support plate (11) and suspended relative to the bottom by mechanical springs e.g. helical springs, of constant stiffness adapted to the weight of the product. The springs are covered in a sheath (9) which limits the risk of extension of the springs beyond their privileged direction of compression.
