Abstract (en)

Production of a printable surface involves impregnating a paper sheet (10), which absorbs liquid synthetic resin over its whole thickness, with the resin (14) from one side (12) of the sheet, so that the resin does not penetrate through the whole of the sheet and the other side (16) remains free of resin. Independent claims are included for: (1) a sheet of paper (10) (specifically with a stretchable structure) having a printable surface (16), obtained by partial impregnation with resin as above; (2) a printable article, at least partially coated with a paper sheet as above; and (3) apparatus for carrying out the process, where the opposite side of the sheet is impregnated with a barrier liquid, consisting of two spaced, opposite liquid application devices between which the sheet passes, liquid synthetic resin being applied to one side of the sheet and barrier fluid to the other.
