Abstract (en)
[origin: WO2005107602A1] A urine collection device is described comprising a funnel having a relatively larger concave hood portion serving as a receptor for urine in fluid communication with a relatively narrower elongate channel portion extending generally away from the receptor hood portion and providing a urine void outlet at a distal end, wherein the receptor hood portion has a perimeter so shaped as to locate in use in the pubic area over at least the area of the labia minora and the urethral and vaginal openings end more preferably over substantially the entire vulva, from the mons pubis to the perineum and the perimeter of the labia majoris, and is provided with a partial closure extending generally across an upper part of said hood so as to extend beyond the urethral opening and at least part of the way towards the vestibule of the vagina in use.
