Abstract (en)  
[origin: WO2005116380A2] A hinge arrangement (10) has first and second portions (12, 18) and a spindle (32). The position of the spindle (32), in the socket (28) is adjustable parallel with and transverse to its axis. Parallel adjustment is by means of a screw thread. Transverse adjustment is by interaction between a circular feature (36) and a slot (58). The geometry of these features converts rotation of the spindle (32) into displacement perpendicular to the axis (16).
