Abstract (en)
[origin: WO2005117742A1] The invention relates to a tooth implant comprising an implant body consisting of at least one intraosseous region that can be anchored in the bone, a penetration region for penetrating the soft tissue, and a coronal region comprising retention pegs, said regions being adjacent in the longitudinal axis of the implant body. The intraosseous region consists of at least three partial regions which are also adjacent in the direction of the longitudinal axis and have different threads.
