Abstract (en)
[origin: WO2005113171A1] The invention relates to a folding machine comprising a machine frame, a lower flange, an upper flange (4), and a pivotable folding flange. According to the invention, a clamping device (7) used to fix at least one upper flange tool (8) to the upper flange is associated with the upper flange, said clamping device comprising a clamping rail (12) provided with a clamping region (14). The inventive folding machine also comprises at least one clamping drive (23) that is supported on the upper flange (4) and acts on the clamping rail (12) at a distance from the clamping region (14) thereof. Said clamping rail is embodied in the form of a rocker, in that it is supported on the upper flange, between the clamping region and the region of the force applied by the at least one clamping drive, by means of traction bearings (20).
