Abstract (en)
[origin: WO2005121600A1] The invention relates to a traction mechanism, in particular for driving the camshafts of an internal combustion engine. Said mechanism comprises a drive wheel, a driven wheel, a traction element and a first and second slide rail. One slide rail can be subjected to a clamping force by a first clamping device that is supported both on the slide rail and externally. The first slide rail is connected to the second slide rail in a manner that transmits a defined force or displacement.
