Abstract (en)

[origin: WO2005114596A1] The invention relates to a device and a method for checking banknotes, whereby measured values for the checked banknotes are obtained and a classification of the banknotes by analysis of the measured values in several checking steps is carried out. The classification differentiates between at least the classification categories of false, presumed-false, and genuine banknotes or acceptable and redistributable and, at least in one checking step of the differentiation of whether the checked banknote belongs to a given classification category, a linking of several measured values is generated and said linking parameter is compared with a corresponding tolerance range on the analysis.
