Abstract (en)
[origin: WO2005116973A1] The invention relates to a method for displaying visual information (9) on a display surface (3, 13, 20, 21). According to said method, a display parameter (P) is modified at trigger intervals in at least one region of the display surface (3, 13) for a subliminal period of time below the human perception threshold. The display parameter (P) is preferably selected from the brightness, colour, illumination, contrast, focus, frequency, or connection/disconnection of the display. Said measure causes a blinking movement to be performed by an observer of the display surface (3) in such a way as to wet the eyes of the observer with tear fluid, thus preventing any eye irritation without the user being aware of the externally controlled blinking.
