Abstract (en)

[origin: WO2005116374A1] The invention relates to a locking device (100) for doors (101, 102) particularly sliding glass doors and the like, comprising: a lock unit (2) to be controlled by a key (20) such as to lock the doors in a closed position and unlock them to allow the relative motion thereof, fastening removable means (1) to at least one of the doors suitable to support the lock unit (2) and mechanically cooperate with the same to lock the doors in said closing position. The device is characterized in that said fastening means are provided with at least one elastically yielding element (12) intended to act on a surface of said at least one door to reduce the backlash between the surface and the fastening means and avoiding that the surface may be damaged while assembling and removing the fastening means.
