Abstract (en)

[origin: WO2006002048A2] A system for controlling wireless phone usage enables a supervisor to establish user profiles for supervised users of wireless phones across a range of parameters, which are stored in a user profile database. Such parameters can include one or more locations, at which use of the wireless phone is restricted or permitted. In addition, restrictions on phone use, such as cumulative usage time, number of messages or number of bytes, can be provided based upon total phone usage within a specified control period, time periods, dates or days of the week during which phone use is restricted or permitted. One or more lists including numbers or other identifiers that are always-accessible can be provided, and one or more lists including numbers or other identifiers that are never-accessible can also be provided. In the event a call, message or browse does not satisfy predefined criteria, the communication attempt is blocked. Predetermined messages can be played or displayed to the called or calling party, as applicable, when a communication attempt is blocked. Boolean combinations of restrictions and permissive use criteria for the wireless phone can be specified to provide for flexibility when establishing use criteria for the wireless phone.
