Abstract (en)
[origin: US2007045331A1] A storage/transport container has a plurality of walls defining an upwardly open vessel having an upper rim and a generally flat cover panel hinged on one of the walls and having an inner edge. The rim has opposite to one of the walls structure forming another inner edge. The cover panel is pivotal into a closed position with the inner edges juxtaposed, retaining formations projecting generally perpendicularly from the inner edge of the cover panel and oppositely from the other inner edge that fit together in the closed position. Hooks are formed on the edges and positioned so as to be opened directly at each other in the closed position. The hooks normally are spaced apart but, on deformation of the cover panel, hook together and preventing separation of the edges.
