Abstract (en)
[origin: WO2006000340A1] The invention relates to a wind deflector for an openable roof of a vehicle and having a displaceable cover element. The wind deflector (10) comprises a deflector element (20) that can be moved into an upright position, is made of a flexible, flat material and has at least two lateral positioning arms (22), the ends of which facing the tail of the vehicle are each articulated in the region of a guide rail (14) that is secured to the roof and which act to move the deflector element (20) between a lowered resting position and an upright, at least partially tensed operating position. According to the invention, the positioning arms (22) each have a retraction device (28) such that, in the operating position, the points of articulation are displaced in the direction of the tail of the vehicle compared to in the resting position and the angle of inclination of the deflector element (20) is reduced when the latter is moved into the upright position.
