Abstract (en)

[origin: WO2005125059A1] The invention relates to a device and method for the transmission of light signals in light waveguides, comprising a laser diode as transmitter of transverse waves and a receiver, connected to the laser diode at least by means of the light waveguide, said transverse waves having an electric and magnetic field strength, a magnetic flux density, a line current density and an electric shift flux density $D_{<i>x}$ and are run from the laser diode to the receiver in the form of plane waves. According to the invention, polarisation-dependent effects, such as variable polarisation, polarisation-dependent damping and polarisation mode dispersion are to be largely avoided. The above is achieved, whereby in the transmitter a short isotropic first light waveguide (4) is connected in a parallel plane after the laser diode (2), with a dielectric constant ϵ_1 , an absolute permeability μ_0 an conductivity k_0 (relative to zero), said first light waveguide (4) having an inclined coupling at an adjustable angle F to a subsequent light waveguide (6, 6'), by means of a coupling point (5). On the receiver side, an analyser (7), for separation of the components of the electric shift flux density D_Z , transmitted parallel to the longitudinal axis (19) of the receiver (3), from the total field D_X, D_Y, D_Z of the transverse wave is provided, the direction of the parallel aligned components of the electric shift flux density $D_{<i>x}$ corresponding to a particular coordinate in a fixed x,y,z- coordinate system (8).
