Abstract (en)
The device has an intermediate element (10) to which a back (1) is connected and screwed on a watch middle (12). The back is pivoted relative to the intermediate element in order to be aligned with 12 hour-6 hour axis of the watch. The back has a circular arc shaped oblong recess (2) in which a ball (6) is housed. The ball cooperates with a stop (34) for driving in rotation the intermediate element until it reaches a locking position on the middle. A sealing device (14) is disposed between the back and the middle.
