Abstract (en)

[origin: EP1760673A2] The present finding concerns a modular structure for making storage blocks for products to be inserted into vending machines. In particular where products (P) of even substantially different size are required to be automatically distributed by one machine. Said structure is characterised in that it foresees that the cells for containing products be defined through elements, arranged vertically (2) and horizontally (3), which removably fit together.
