Abstract (en)  
The device has a press (1) and a conveying device (2) for gradually supplying of blades (4) in a press area (3) of the press, so that blades pile (5), which is formed after pressing the finished profile, is directly formed in the press area of the press. The press area is opened upwards, so that the conveying device can insert the blades from top in the press area. A locking unit (7) is arranged at an upper opening. An independent claim is also included for a method of manufacturing profiles e.g. composite lumbers.
