Abstract (en)

[origin: EP1764138A1] The ski is fitted with guiding elements (1) for adjusting two binding units, each to be connected to a narrow linear segment (5,6). The segments (5,6) are secured with a lever (11) provided with a toothed outer edge engaging with the toothed outer edges (8,9) located along one side of each of the segments (5,6) also engaging with teeth alongside a carrying element (7). The locking lever (11) can be rotated around a vertical axis (12) in order to release and engage the toothed areas. The central carrying element (7) is still connected to the ski when the distance between the two binding units is changed.
