Abstract (en)

[origin: EP1764551A1] The elliptical headlight (10) with a multi-position main mask (16) and an auxiliary mask (17) in front of its light source (14) and reflector (12) has the auxiliary mask able to rotate about an axis (B) lying across the light's optical axis and in front of the main mask's axis of rotation (A). The auxiliary mask can be rotated between two positions, one outside the light beam and another in which it masks part of the beam to create an anti-dazzle dipped beam to the right or left, depending on the direction of traffic.
