Abstract (en)
In an automobile drive recorder, if a detection signal indicating an occurrence of an abnormal driving state is output by an abnormal state detection sensor (2f, 2r), image data of a scene taken by a monitoring camera (1f, 1r) are recorded for a period with a particular length together with additional information associated with the driving state into a record memory (15) as drive record data. The automobile drive recorder includes a magnetic sensor (2f, 2r) serving as the abnormal state detection sensor adapted to detect a magnetic field in a close region around the automobile, approaching vehicle detection means (26) for detecting an abnormally approaching vehicle by detecting a change at a rate greater than a predetermined value in the signal level of the detection signal output by the magnetic sensor (2f, 2r), and frame rate switching means (23) for controlling the frame rate at which to record the image data.
