Abstract (en)

[origin: US2007215627A1] A closure of a vessel which includes a main body coupled to an entrance of the vessel, an elevation member formed with a discharging passage discharging contents stored in the vessel, the elevation member being inserted into the main body, moved up or down in the main body, and sealing or opening the discharging passage, and a cover detachably coupled with the main body, the cover moving the elevation member up or down by being rotated in a positive direction or a negative direction, and is convenient for use because the elevation member opens or seals the vessel by being moved up or down in accordance with the rotation of the cover covering the main body in a positive direction or a negative direction, and sanitarily cleanliness may be maintained because touching the discharging passage of the elevation member by hand is unnecessary, is disclosed.
