Abstract (en)

[origin: WO2005118623A1] Angiogenesis, the formation of new blood vessels, is an integral part of normal physiological and developmental processes as well as several pathologies, ranging from tumor growth and metastasis to inflammation and ocular disease. Methods and compositions are provided for controlling normal angiogenesis and for treating angiogenesis associated or mediated diseases as well as for preventing cancer progression and metastasis through the use of a prostate secretory protein (PSP) family member.
