Abstract (en)

[origin: EP1767359A2] The printer unit has print works (04) working together with two different sides of the web, where each of the printing works consists of a cylinder (06, 07). The cylinders are brought into a print-on position by actuators that are pressurized by a pressurizing medium. Two supply systems (75.1, 75.2), which are operated independently of each other, are provided for supplying the pressurizing medium to the actuators. The actuators are attached to both cylinders that are arranged on the sides of the web. An independent claim is also included for a method for adjusting a print-on-position of both cylinders of print works.
