Abstract (en)
An object with an optical effect in which the surface zone with the optical effect has at least two image patterns (12,14) lying one behind the other and with a change in the viewing angle, the optical perception of the complete image changes, where a first image pattern (12) is formed on the surface of a material layer (10), and the second image pattern (14) through holographic coding virtually lies in the apparent space (d) to the first (12) image pattern. An independent claim is included for application of an object in the form of a package.
