Abstract (en)
The invention relates to an awning arm support with inclination adjustment comprising a boss (1) with a through hole (2) housing a pin (3) the projecting ends of which are coupled to respective branches (5a, 5b) of a fork at one end of an awning arm (6). The trough hole (2) defines a cavity suitably shaped for guiding an angular oscillation of said pin (3) in an oscillation plane. A first pushing element (7) is arranged to push the pin (3) in a first direction substantially parallel to said oscillation plane and a second pushing element (10) is arranged to push the pin (3) in a second opposite direction to adjust and fix the inclination of the arm (6) between both. The first and second pushing elements (7, 10) can be accessed through respective first and second openings (8, 11) in at least one surface of the boss (1).
