Abstract (en)  
The stove has a fire chamber (5) and an exhaust gas traction (6) formed from a fireclay and forming a stove core. The core is surrounded in all sides by an encircling wall. A warm air stove (11) is arranged in direct proximity to a base stove (1). The chamber and traction are formed from metal and form a heating unit (12). An exhaust gas outlet (8) of the base stove is attached at a chimney, where the outlet and an air film around the core are connectable over a hermetically sealed air cover (21) with the air film around the heating unit. The film is connected by the cover with ambient air. An independent claim is also included for a method for operating a double stove.
