Abstract (en)

The invention concerns a flexible tie (4), terminated in a widened portion provided with a passage (12) through which the tie may be inserted, the passage comprising means for retaining the tie, arranged inside a housing, and the seal comprises a control chip (3) for verifying the identification of the seal or of the related product. It further comprises a box-shape container (3) capable of containing the chip and of receiving the chip and the housing of the retaining means and provided with means for introducing the passage of the tie (4) simultaneously through the passage (12) and the container (3). When the tie passes through the passage and the housing, the container is maintained in its operating position and when the tie is cut off, the container can be extracted for use in another seal. The chip can be recovered and reused after said seal has been broken.
