Abstract (en)

The method involves recording the temperature of an electrical cooking device, cookware (13) provided in the device and/or a cooking ware content by a temperature-sensor device (S). The temperature signal (T) recorded by the temperature-sensor device in a temporal process is once differentiated after a time. The result is inverted and the inverted result is exponentiated with exponential values between 0.5 and 1.0 to provide an initial value, which is further processed and evaluated. An independent claim is also included for a method for operating an electrical cooking device and hob under application of results of temperature evaluation.
