Abstract (en)

[origin: WO2006002975A1] Disclosed is a method for assembling insulating glass panes filled with a gas other than air. According to said method, - a first glass sheet (13) and a second glass sheet (14) that is provided with a spacer (38) are arranged in a vertical or inclined position so as to face each other without the first glass sheet (13) touching the spacer (38); - a chamber that encloses the intermediate space between the glass sheets (13, 14) is formed by disposing a belt (7) which seals the bottom of the chamber on the bottom edge of the glass sheet arrangement while at least one sealing device (22) is placed next to the protruding edges of the glass sheet arrangement, respectively, said sealing device (22) extending downward from a point located above the belt (7) to the belt (7) while forming a forward and a rear end of the chamber; - the gas that is different from air is introduced into the chamber from below and the insulating glass pane is closed by moving the glass sheets (13, 14) closer to each other after reaching a desired filling level. According to the invention, one of the two glass sheets (13) is kept at a distance from the belt (7) when the gas that is different from air is delivered, and the gas that is different from air is introduced into the chamber through a gap between the belt (7) and the bottom edge of the glass sheet (13) which is kept at a distance from the belt (7).
