Abstract (en)

[origin: WO2005119685A1] A package for at least one information carrier with an outside contour and a central opening, provided with a bearing surface on which a contour edge is provided and a retaining device, the retaining device comprising an edge which, during use, extends along the inside of the central opening of an information carrier and bears a first projection which lies at a distance from said bearing surface and can engage, at least partly, a top side of an information carrier, the retaining device further comprising a resilient element which is connected to the bearing surface and/or the edge and bears a second projection which lies at a distance from said bearing surface and can engage, at least partly, a top side of an information carrier, the arrangement being such that through elastic deformation of the resilient element, the second projection can be moved in the direction of the first projection for releasing the information carrier.
