Abstract (en)

A planographic printing plate package formed by valley-folding side surfaces at both end portions of packaging paper in which a bundle of planographic printing plates processed into a predetermined length is wrapped in a tubular manner, superposing upper surfaces and lower surfaces of both end portions of the packaging paper, and folding back and joining together the upper surfaces and the lower surfaces toward the upper side of the planographic printing plates, wherein points of intersection where pairs of valley fold lines formed at the time of the valley folding intersect each other are positioned higher than fold-back lines in the upper surfaces of both end portions of the packaging paper. A package and a packaging apparatus and packaging method for the package are provided which can block the entrance of light from outside in a packaged state.
