Abstract (en)

A photostimulable storage phosphor screen or panel suitable for use in mammographic applications comprises on a support, a storage phosphor layer and, adjacent thereto, an outermost top-coat layer, wherein said outermost top-coat layer has a roughness profile such that a mean or average spacing S_m between peaks as measured by means of a perthometer following profile peaks and valleys of said top-coat is less than 150 μm , said spacing being defined by downward crossing of a mean line, followed by upward crossing up to next downward crossing of said mean line over one roughness profile periodic intersection of said mean line, and wherein S_m is calculated as an average distance of spacings between roughness profile periodic intersections.
