Abstract (en)

[origin: EP1772370A2] A movement device, in particular for sliding doors (54) of boats, suitable for allowing the opening and closing actuation of the sliding door (54) according to a direction substantially parallel to the longitudinal development of the boat; the device essentially uses a motor-driven hinge, which is manually adjustable into position, even over time, relative to the door (54), through adjustment means (31, 32, 33), positioned inside shaped slots (55, 56, 57), in turn obtained onto respective plates (13, 17, 19) and/or self-centering disks (22, 23, 24), mounted at the sides of the hinge, so as to ensure complete adaptability and adhesion of the sliding door (54) to the hull (53) of the boat.
